Engineering Certification	4
Design Notes	5
Definitions & Terminology	6

BOXSPAN SPAN TABLES

RESIDENTIAL FLOORS

Standard Floor Types (Dead Load 0.75 kPa i.e. particle board, 15mm compressed FC sheet)

Floors & decks up to 1m above ground

• Joists – Supporting floor loads only (or decks less than 1m above ground)	Table 1	7
• Bearers – Supporting floor loads only (or decks less than 1m above ground)	Table 2	8
• Bearers – Supporting floor loads & load bearing walls (Single Storey - Sheet Roof)	Table 3	9
• Bearers – Supporting floor loads & load bearing walls (Single Storey - Tiled Roof)	Table 4	10

Decks more than 1m above ground

• Joists – Supporting decks more than 1m above ground	Table 5	11
• Bearers – Supporting decks more than 1m above ground	Table 6	12

Heavier Floor Types (Dead Load 1.1kPa i.e. 75mm aerated concrete panels, 18mm compressed FC sheet)

Floors & decks up to 1m above ground

• Joists – Supporting floor loads only (or decks less than 1m above ground)	Table 7	13
• Bearers – Supporting floor loads only (or decks less than 1m above ground)	Table 8	14
• Bearers – Supporting floor loads & load bearing walls (Single Storey - Sheet Roof)	Table 9	15
• Bearers – Supporting floor loads & load bearing walls (Single Storey - Tiled Roof)	Table 10	16

Decks more than 1m above ground

• Joists – Supporting decks more than 1m above ground	Table 11	17
• Bearers – Supporting decks more than 1m above ground	Table 12	18

LINTELS

• Lintels – Supporting roof loads only	Table 13	19
• Lintels – Supporting girder truss	Table 14	20
• Lintels – Supporting roof & single storey floor loads	Table 15	21

ROOFS

Rectangular Buildings

• Rafters	Table 16	22
• Ridge & Intermediate Beams	Table 17	23
• Ceiling Joists	Table 18	24

Attached Awnings & Verandahs

• Rafters	Table 19	25
• Purlins	Table 20	26
• Roof Beams	Table 21	27

Freestanding Carports & Roofs

• Rafters	Table 22	28
• Purlins	Table 23	29
• Roof Beams	Table 24	30

Common Connections	31
Material Specifications	35

These Boxspan® Residential Span Tables provide detailed product, design and typical installation information. The information in this guide can be used for the design of sub-floors, second storey floors, and a number of roof types and beams including lintels.

BOXSPAN - STEEL BEAMS USED IN AUSTRALIAN BUILDING FOR OVER 30 YEARS

Boxspan® is a roll formed beam manufactured from two interlocked "C" shaped sections of high tensile, zinc coated steel, which provide a rectangular profile resembling traditional timber. Unlike timber, the high-tensile steel and hollow section produces a strong and long spanning beam, which will not twist or sag with time. This unique system provides the benefits of a full protective zinc coating on the inside and outside of the beam.

Boxspan® has the unique qualities of having a double thickness flange and a single thickness web that effectively puts the strength where it needs to be. The beam is strong, easy to use and has high torsional stability, unlike some other steel profiles.

Boxspan is manufactured in a range sizes from 100 x 50 mm to 250 x 50 mm, ensuring that an economical beam selection can be obtained for each project.

The beams are produced to controlled tolerances to the required length up to 12m or can be easily cut on site if necessary. The extensive range of brackets and accessories available with Boxspan makes it easy to use and a simple substitute for timber.

The Benefits of using Boxspan

- **Minimal maintenance**, galvanized inside and out.
- **Rolled to exact lengths**, minimal waste produced.
- **Won't rot, twist or shrink**, steel is a stable, durable product that is not permanently affected by the environment.
- **Straight and true to size**, manufactured to tight tolerances.
- **Termites won't eat it**, will not attract or harbor termites and no on-going chemical treatments required.
- **Lightweight**, the efficient use of steel allows a strong beam to be produced from thin steel sheet.
- **Easy to install**, an extensive range of brackets ensures easy fixing in a large range of applications.
- **Non-combustible**, steel is a non-flammable material and ideal for construction in bushfire prone areas.

Structural Assessment of Spantec Systems BOXSPAN® Residential Span Tables Publication - January 2016

This assessment has been certified by Spantec's Engineer for the structural design spreadsheets and span tables as described in Spantec Systems publication **BOXSPAN® Residential Span Tables - January 2016** and consider that they comply with the following structural provisions on the National Construction Code of Australia (NCC) 2019:

- Volume One, Structural Provisions - Part B1.4
- Volume Two, Steel Framing - Part 3.4.2

The assessment considered the following

- The design spreadsheets to determine the values of frame spacing, member span, and connection capacity to populate the span tables in this publication comply with generally accepted engineering principles and the following Australian Standards:
 - AS/NZS 1170.0- 2002 Structural design actions – Part 0: General Principles
 - AS/NZS 1170.1- 2002 Structural design actions – Part 1: Permanent Imposed and other actions
 - AS 4055-2012 Wind Loads for Housing
 - AS/NZS 4600- 2018 Cold-Formed Steel Structures
 - AS 3566.1-2002 Self drilling screws for the building and construction industries – Part 1 General requirements and mechanical properties
 - NASH Standard: 2005 Residential and low-rise steel framing – Part 1: Design criteria
- The design capacities of: Shear (Vv), Compression (Nc), Tension (Nt), Bearing (Rb); and connection capacities have been determined in accordance with Australian Standards AS/NZS 4600:2018 – Cold-formed steel structures and AS 3566.1:2002 – Self drilling screws for the building and constructions industries – Pat 1: General requirements and mechanical properties
- For wind loading Serviceability wind speeds have a default minimum value as presented in AS 4055-2012 Wind loads for housing
- The scope of this structural assessment considers design wind pressures for Non-Cyclonic Areas only

This certification may be considered as "Evidence of Suitability" under the National Construction Code of Australia (NCC) 2019, Volume One Clause A2.2 Performance Solution. Information in the Spantec Systems publication not specifically referenced in this certification is outside the scope of this assessment. This certification does not relieve other parties of their responsibilities.

Peter J. Barreca
Civil & Structural Engineer
BE, MIE Aust CPEng NER N° 353640
Spantec Systems Pty. Ltd

1. These span tables have been prepared for a range of flooring and roofing applications in non-cyclonic wind regions using Boxspan® steel beams and brackets produced by Spantec Systems Pty Ltd.
2. This Design Notes section shall be read in conjunction with Boxspan Residential Span Tables – Non Cyclonic Areas publication.
3. Spantec Boxspan and connection components, comply with the following Australian Standards:
 - AS 1397:2011 Steel sheet and strip – Hot dipped zinc-coated or aluminium/zinc-coated
 - AS 3566.1:2002 Self drilling screws
4. The design of Boxspan and connection components, comply with the following Australian Standards:
 - AS/NZS 1170.0:2002 Structural design actions – Part 0: General principles
 - AS/NZS 1170.1:2002 Structural design actions – Part 1: Permanent imposed and other actions
 - AS/NZS 1170.2:2011 Structural design actions – Part 2: Wind actions
 - AS 4055:2012 Wind loads for housing
 - AS/NZS 4600:2005 Cold-formed steel structures
 - NASH Standard, Residential and Low-rise Steel Framing, Part 1: Design Criteria 2005
5. The connection details shall be in accordance with the details in this publication. For the complete range of connections please refer to Spantec.com.au website or speak with Spantec's Technical department.
6. The loads to determine the span tables in the Spantec publication – Boxspan Residential Span Tables – Non Cyclonic Areas are as follows:

FLOOR LOADS

- Dead Loads: 0.75kPa (includes the weight of either particle board and carpet or up to 15mm compressed FC sheet with tiles and including Boxspan beams only).
- Dead Loads: 1.1kPa (includes the weight of either 75mm aerated concrete panels or up to 18mm compressed FC sheet with tiles and including Boxspan beams only).
- Live Loads: 1.5kPa for internal residential floor loads and deck floor loads that are no greater than 1m above ground. 2.0kPa for external deck floor loads greater than 1m above ground level.

ROOF LOADS

- Dead Loads: 0.20kPa, 0.40kPa (includes the weight of the roof (sheeting & flashings) and Boxspan beams only).
 - Dead Loads: 0.15kPa (includes the weight of plasterboard ceiling and Boxspan beams only).
 - Live Loads: 0.25kPa (non trafficable roof). The span tables have NOT considered the 1.4kN maintenance loading and propping and crawl boards are recommended when accessing the roof.
 - Wind Loads: Wind classes in accordance with AS4055:2012 and wind pressures in accordance with AS1170.0:2002 and AS1170.2:2011.
7. The maximum height of single storey construction allowed for in the Boxspan span tables shall be in accordance with AS/NZS 1170.2:2011 requirements.
 8. These span tables do not take into account the design, certification or structural adequacy of any:
 - Existing foundation
 - New foundation
 - Connection to the foundation
 - Connection to the existing structure
 - Structural adequacy of the structure to support additional floor and or roof loads

The builder/owner is to ensure that the necessary approvals (certifications) are obtained for the structure from a structural engineer or other relevant parties.

The builder/owner should also ensure the requirements of local authorities and government regulations are addressed.

9. Proprietary items supplied by others shall be installed in accordance with the manufacturer's specification.
10. The span tables have been prepared for attached 1 side and free-standing, 4 sides open or 3 sides open/1 enclosed sides pitched roofs that are 'Empty Under' ($\leq 50\%$ blocking) in accordance with AS/NZS 1170.2:2011 requirements. For other awning arrangements, use the 'Awning Selection Tables' section to determine type and reduction factor.
11. The designer shall ensure that the Boxspan protective coating (Z450 or equivalent) meets acceptable construction practice (steel framing) reference NCC 3.4.2.1 & 2. Z450 (or equivalent) coating is available on most products should a higher coating be required.

SPANS

The tables in this publication refer to three types of spans. See diagram on the right. For a member to be in continuous span the smallest span must be greater than 80% of the other span/s or equal to them. Under no circumstances should there be a join unsupported.

SPACING/CENTRES

Span tables for floor joists, rafters and ceiling joist are determined using their spacing (centre to centre) to determine their respective spans. Please refer to spacing diagram above each table.

CANTILEVER

Cantilevered joists have been designed to support a live load of 3.0kPa for balconies. Care is to be taken by the builder to ensure total weather protection to prevent moisture entering the building. As a rule the back span of the member shall not be less than 2 x the cantilevered span.

FLOOR LOAD WIDTHS

Floor with cantilevered balcony

Floor with verandah roof & deck

BEARER	FLW CALCULATION
A	$FLW = (X \times 0.375) + W$
B	$FLW = 1.25 \times \frac{(X + Y)}{2}$
C	$FLW = Y \times 0.375$
D	$FLW = \frac{W}{2}$
E	$FLW = (X \times 0.4) + \frac{W}{2}$
F	$FLW = 1.1 \times \frac{(X + Y)}{2}$
G	$FLW = 1.1 \times \frac{(Y + Z)}{2}$
H	$FLW = 0.4 \times Z$

ROOF LOAD WIDTHS

WALL	RLW CALCULATION
A	$RLW = X + W$
B	$RLW = X + \frac{W}{2}$
C	$RLW = W + \frac{W}{2}$
D	$RLW = W + \frac{U}{2}$
E	$RLW = \frac{(U + V)}{2}$
F	$RLW = \frac{(V + X)}{2}$
G	$RLW = W + \frac{X}{2}$

JOISTS

Spans governed by dynamic performance

FLOOR PERFORMANCE

Suspended floor frame performance can be subjective based on the end user’s perception. In order to satisfy the large majority of users it is noted that:

1. The maximum allowable spans have been designed to meet the strength and serviceability limits specified in NASH Standard, Residential and Low-rise Steel Framing, Part 1: Design Criteria 2005.
2. In some cases spans calculated by the above criteria have been reduced based on testing carried out at a NATA approved testing laboratory and extensive field testing carried out over more than 20 years.

Should a stiffer floor be required joist spans or joist spacing can be reduced or mid span blocking introduced. It is noted that floor carrying higher distributed loads (such as floor tiles or aerated concrete floors panels) or supporting non load bearing walls will be stiffer than floors carrying lower loads.

Floors will not reach their peak performance until carrying design dead loads. This includes, in particular, loads applied by internal and external walls including plasterboard and (for upper floors) ceilings fixed below.

BEARERS

Spans governed by dynamic performance

FLOOR PERFORMANCE

Suspended floor frame performance can be subjective based on the end user’s perception. In order to satisfy the large majority of users it is noted that:

1. The maximum allowable spans have been designed to meet the strength and serviceability limits specified in NASH Standard, Residential and Low-rise Steel Framing, Part 1: Design Criteria 2005.
2. In some cases spans calculated by the above criteria have been reduced based on testing carried out at a NATA approved testing laboratory and extensive field testing carried out over more than 20 years.

Should a stiffer floor be required joist spans or joist spacing can be reduced or mid span blocking introduced. It is noted that floor carrying higher distributed loads (such as floor tiles or aerated concrete floors panels) or supporting non load bearing walls will be stiffer than floors carrying lower loads.

Floors will not reach their peak performance until carrying design dead loads. This includes, in particular, loads applied by internal and external walls including plasterboard and (for upper floors) ceilings fixed below.

BEARERS
SUPPORTING DECKS MORE THAN
1m ABOVE GROUND

- Decking boards
- 15mm compressed FC sheeting + tiles
- Live Load: **2.0kPa**
- Dead Load: **0.75kPa**

Spans governed by dynamic performance

FLOOR PERFORMANCE

Suspended floor frame performance can be subjective based on the end user’s perception. In order to satisfy the large majority of users it is noted that:

1. The maximum allowable spans have been designed to meet the strength and serviceability limits specified in NASH Standard, Residential and Low-rise Steel Framing, Part 1: Design Criteria 2005.
2. In some cases spans calculated by the above criteria have been reduced based on testing carried out at a NATA approved testing laboratory and extensive field testing carried out over more than 20 years.

Should a stiffer floor be required joist spans or joist spacing can be reduced or mid span blocking introduced. It is noted that floor carrying higher distributed loads (such as floor tiles or aerated concrete floors panels) or supporting non load bearing walls will be stiffer than floors carrying lower loads.

Floors will not reach their peak performance until carrying design dead loads. This includes, in particular, loads applied by internal and external walls including plasterboard and (for upper floors) ceilings fixed below.

Spans governed by dynamic performance

FLOOR PERFORMANCE

Suspended floor frame performance can be subjective based on the end user’s perception. In order to satisfy the large majority of users it is noted that:

1. The maximum allowable spans have been designed to meet the strength and serviceability limits specified in NASH Standard, Residential and Low-rise Steel Framing, Part 1: Design Criteria 2005.
2. In some cases spans calculated by the above criteria have been reduced based on testing carried out at a NATA approved testing laboratory and extensive field testing carried out over more than 20 years.

Should a stiffer floor be required joist spans or joist spacing can be reduced or mid span blocking introduced. It is noted that floor carrying higher distributed loads (such as floor tiles or aerated concrete floors panels) or supporting non load bearing walls will be stiffer than floors carrying lower loads.

Floors will not reach their peak performance until carrying design dead loads. This includes, in particular, loads applied by internal and external walls including plasterboard and (for upper floors) ceilings fixed below.

NOTES:

1. Suitable for brick wall structures in good condition that have been designed and constructed in accordance with AS3700 masonry structures.
2. A minimum of ten courses of brick work must be above screwbolts.
3. Older masonry structures must be checked for structural integrity by an independent engineer.
4. Do not overtighten screwbolts on to boxspan, maintain a 47 to 50mm waling plate width.

BOXSPAN

Boxspan® light structural steel beam is a cold formed structural 'box-section' manufactured from two high tensile zinc coated 'C'- sections which are interlocked together by a patented staking process on the top and bottom flanges to form a rigid rectangular hollow section.

IDENTIFICATION

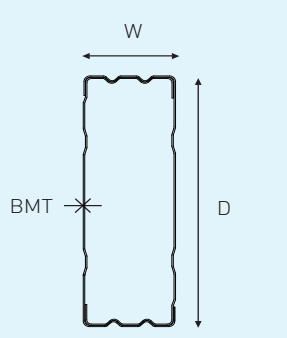

Boxspan members are identified by the marking system as follows.

Product Description (Boxspan: B)	Depth of section (mm)	Material Gauge Total thickness of metal at the Flange. 2 x Base Metal Thickness (BMT) x 10
B	100	20

Other variations of Boxspan beams with prefixes are: (XB: Boxspan Z450 (or equivalent) Coating, SB: Smart Bearer)

DIMENSIONS

The dimensions and mass of Boxspan members are shown in the tables that follow.

	Boxspan Section	Dimensions D x W (mm)	Base Material Thickness BMT (mm)	Mass (kg/m)
	B100-12	100 x 50	0.60	2.13
B100-16	100 x 50	0.80	2.80	
B150-16	150 x 50	0.80	3.50	
B150-20	150 x 50	1.00	4.32	
B200-16	200 x 50	0.80	4.11	
B200-20	200 x 50	1.00	5.10	
B250-20	250 x 50	1.00	5.91

BOXSPAN MATERIAL SPECIFICATION

Boxspan light structural steel beams are made from zinc coated high tensile grade G550 steel complying with the AS 1397:2011 (AS1397/G550 Z450). Base metal thicknesses (BMT) of the products are: 0.60mm; 0.80mm and 1.00mm.

COATING SPECIFICATION

Boxspan is rolled from sheet metal with zinc coating of Z450 (or equivalent). The Z450 coating relates to a minimum zinc coating in accordance with AS 1397:2011 (g/m² = grams of zinc per m²).

The Building Code of Australia provides guidance on the minimum coating class required for cold-formed steel members with regards to the surrounding environmental conditions (i.e., industrial or coastal). The designer shall approve the adequacy of the coating for the intended use of Boxspan.

MANUFACTURING TOLERANCES

The tolerances for Boxspan members are within the manufacturing tolerance requirements outlined in Appendix D of the NASH Standard, Residential and Low-rise Steel Framing, Part 1: Design Criteria 2005.

BRACKETS

Spantec produce a range of brackets that allow a very large number of floor and roof configurations to be assembled. The arrangement of the brackets are outlined in the 'Connection & Installation Details' section.

The brackets are supplied to suit the different Boxspan depths as well as a range of angles and roof pitches.

BRACKET MATERIAL SPECIFICATION

Boxspan structural brackets are made from zinc coated G2 grade steel complying with (AS1397/G2 Z450) and AS/NZS 1365:1996. Base metal thicknesses (BMT) of the brackets range from 0.9mm – 1.55mm.

COATING SPECIFICATION

The brackets are rolled from sheet metal with the zinc coating of Z450 (or equivalent). The Z450 coating relates to a minimum zinc coating in accordance with AS 1397:2011.

The Building Code of Australia provides guidance on the minimum coating class required for cold-formed steel members with regards to the surrounding environmental conditions (i.e., industrial or coastal). The designer shall approve the adequacy of the coating for the intended use of Boxspan.

Hot dipped galvanized brackets are also available for fixing Boxspan with higher zinc coating.

FASTENERS

Spantec supply a range of fasteners for bracket fixing and fixing to structural steel. The class of finish on the screws shall comply with requirements of AS 3566.1:2002 or other applicable standard. The fastener type and quantity required for the connection type are shown in a table with the connection detail.

The screws in the Connection Details section are the minimum size for the quantity shown. A larger screw size with the same head type may be substituted.

Description	Application	Class of Finish
12-14x20mm Hex Head self drilling screw (Tek screw)	To connect brackets to Boxspan	Class 3 (AS 3566)
10-16x16mm Wafer Head self drilling screw (Tek screw)		
12-24x20mm Hex Head self drilling screw (3-5mm thickness)	To connect brackets to structural steel	Class 3 (AS 3566)
12-24x32mm Hex Head self drilling screw (4-10mm thickness)		
12-14x75mm Hex Head self drilling screw (Tek screw)	Long fixing screws to laminate beams and to fix to brackets from one side only.	Class 3 (AS 3566)
